

Relamping: a sustainable choice for the environment

In our continuous commitment to environmental sustainability and energy efficiency, we have carried out a relamping intervention, i.e. the replacement of old lighting systems with new low-consumption technologies, in particular high-efficiency LEDs.

This operation, in addition to improving the quality of lighting, allows a significant reduction in energy consumption, making a concrete contribution to reducing CO₂ emissions and reducing the environmental impact of our activities.

Energy efficiency is one of the fundamental levers for building a more sustainable future. This intervention is part of a broader ecological transition program, in line with the goals of the 2030 Agenda for Sustainable Development.
